

Hypotheses

H1. Previous phenological events constrain later events. E.g., late-fruiting species fruit late in the season because they flower later in the growing season. (Inter-phenophase duration is not a good predictor of later phenology.)

H2. Inter-phenophase duration constrains phenology. E.g., late-fruiting species set fruit late in the season because they require longer development time. (The previous phenological event is not a good predictor of later phenology.)
